Context Bridge

FIWARE

Search public service records, inspect their linked sources and verify local review updates through a real NGSI-LD broker.

REAL PUBLIC DATA BENCHMARK

Working Python application over a local Antares NGSI-LD broker.

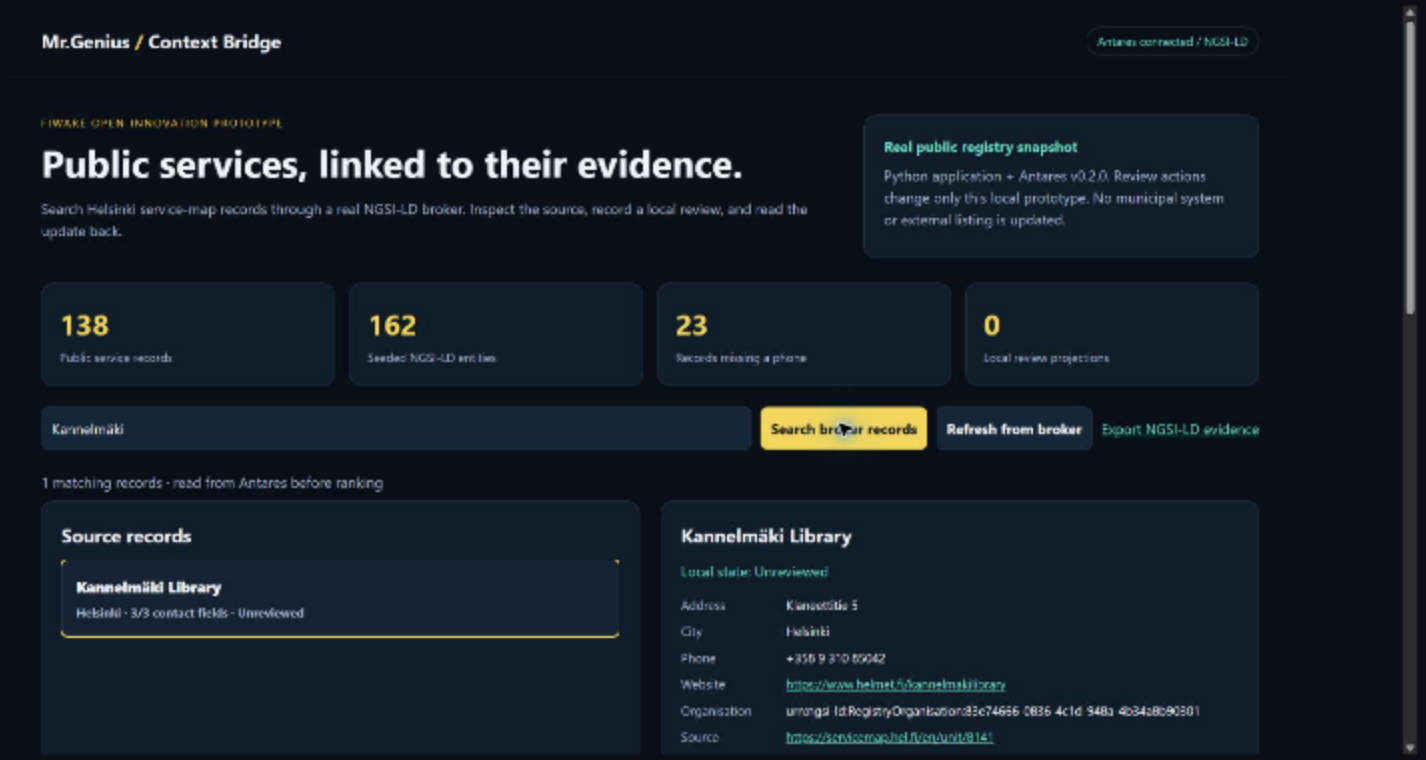

Public service records need interoperable evidence

Put attributed records into an NGSI-LD Context Broker. Preserve organisation relationships and verify local reviews through the same API.

Decision design

Evidence stays visible. A human reviewer controls the next action.

Working application over Antares

Python produces NGSI-LD entities and organisation relationships. Antares v0.2.0 stores and queries context. TF-IDF ranks returned records. Review events link to a target, PATCH updates its local state, and GET verifies the result.

Measured public benchmark

138

Public service records

162

Seeded context entities

10

Integration tests passed

Antares stores 138 public service records and 24 organisation entities. End-to-end verification creates a review event, updates the target state and reads it back.

Public benchmark only. No company records or deployment results.

Computed evidence: Registry contact completeness

Records by available address, phone and website fields

Data provenance and practical limits

City of Helsinki Service Map, https://servicemap.hel.fi . CC BY 4.0. No endorsement. Antares v0.2.0 by joinedcontext, EUPL 1.2.

https://www.hel.fi/palvelukarttaws/rest/v4/unit/?search=kirjasto

Public registry snapshot, not current operating status. Some units match library-related services rather than a standalone library. Source fields may be incomplete. Review decisions are local prototype annotations, not municipality or business-owner approval. Antares runs in memory. Review projections reset on restart. No full ETSI conformance certification or production authentication is claimed.

Company pilot and next decision

Demonstrate Context Bridge live for the independent FIWARE award. Next, agree on an approved municipal workflow, add authentication and validate source freshness before production integration.

Pilot success criteria are proposed, not measured outcomes.

Independent FIWARE award route. A working live demonstration is required. Company challenge assignment is separate and remains pending.
